

CANDIDATE SCORING ANALYSIS REPORT

AI-Powered Interview & Communication Assessment

CANDIDATE

Pushkaran Tyagi

ASSESSMENT DATE

21 August 2026

ROLE APPLIED FOR

**Software Engineer – Backend
(Campus Hiring)**

OVERALL FINAL SCORE

79 / 100 — Strongly Recommended

Executive Summary

Pushkaran Tyagi completed the AI-proctored assessment for the role of **Software Engineer – Backend (Campus Hiring)** on 21 August 2026. The system evaluated verbal, non-verbal and content-based signals captured during the recorded interview session, combining computer-vision, prosody/audio, and NLP-based semantic scoring pipelines to produce a composite performance profile.

Composite Performance Radar

The radar chart plots five composite dimensions derived from the raw behavioral and linguistic signals captured by the analysis engine. Scores of 75+ indicate strong, interview-ready performance; 60–74 indicates a competent but improvable area; below 60 flags a dimension for coaching.

1. Visual & Non-Verbal Analysis

Derived from frame-level computer-vision tracking during the recorded session — eye-contact ratio, posture stability, gaze consistency, blink rate, head nodding and facial affect (smile/warmth).

Metric	Raw Signal	Score	Interpretation
Eye Contact	eye_contact = 0.82	82	Maintained consistent camera engagement.
Posture	posture_score = 0.88	88	Upright, stable posture throughout.
Gaze Stability	gaze_score = 0.80	80	Minimal off-screen glances.
Blink Pattern	blink_score = 0.75	75	Within normal, non-anxious range.
Nodding	nod_count = 14 · score = 0.70	70	Moderate affirmative engagement.
Smile / Warmth	smile_score = 0.65	65	Reserved expressiveness; room to warm up.

2. Vocal & Prosody Analysis

Derived from audio waveform and prosody modeling — pitch, energy, speech rate and overall vocal confidence extracted from the interview recording.

Metric	Raw Signal	Score
Audio Confidence	audio_confidence = 0.78	78
Pitch Stability	pitch_mean = 185.4 Hz · pitch_std = 22.1	72
Energy Consistency	energy_mean = 0.62 · energy_std = 0.11	69
Speech Pace	speech_rate_wpm = 132 wpm	74

Note: Speech pace of 132 wpm sits within the recommended 120–150 wpm interview range. Pitch and energy variability suggest slightly reduced vocal dynamism during longer answers — a common, easily-coached pattern.

3. Language & Content Analysis

Derived from the transcript via NLP scoring — semantic relevance to the question bank, answer quality, sentiment, vocabulary diversity (lexical TTR) and filler-word density.

Metric	Raw Signal	Score
Answer Quality	answer_quality = 0.83	83
Semantic Relevance	semantic_score = 0.85	85
Sentiment (Positivity)	sentiment = 0.71	71
Vocabulary Diversity	lexical_ttr = 0.54	54
Filler-Word Control	filler_density = 0.08 (lower is better)	92

Final Recommendation

Overall Score: 79 / 100

Recommendation Level: 4 / 5 — **Strongly Recommended**

Vendor Decision: Pending Review

AI-Generated Summary

Pushkaran Tyagi demonstrated strong content relevance and answer quality, backed by confident posture and steady eye contact throughout the session. Vocal delivery was clear and well-paced, though pitch and energy variation could be more dynamic in extended responses. Facial expressiveness was comparatively reserved — practicing more animated delivery would strengthen overall presence. No proctoring violations were flagged during the session.

Strengths

- High semantic relevance and answer quality (85 / 83)
- Stable posture and strong eye contact (88 / 82)
- Excellent control over filler words (92)
- Speech pace within ideal interview range (132 wpm)

Areas for Improvement

- Facial expressiveness / warmth (smile score 65)
- Vocal energy and pitch dynamism across longer answers
- Vocabulary diversity could be broadened (lexical TTR 54)

This report is generated by an automated AI scoring pipeline and is intended to support, not replace, human hiring judgment. Scores reflect observable communication and behavioral signals only.
